Beef

What is it?

Type
Meat

Environmental footprint (per kg of food)

Beef shows a range, because the data has two production systems for it

Greenhouse gases (kg CO2e per kg)
33.3 to 99.5

Land use (m^2 per kg)
43.2 to 326.2

Water (liters per kg)
1,451 to 2,714

Nutrition (average per 100g of food)

Energy (kcal per 100g)
182.16

Protein (g per 100g)
21.24

Fat (g per 100g)
9.73

Carbohydrates (g per 10
1.83

Saturated fat (g per 100
3.96

Fiber (g per 100g)
0.34

Salt (g per 100g)
1.24

Sugars (g per 100g)
0.59

Example products in this category (up to 10)

2.46

Share ultra-processed
42%

What could replace it?

Plant-based swaps and what you gain or lose

Pick an animal-based food

animal_category

Beef

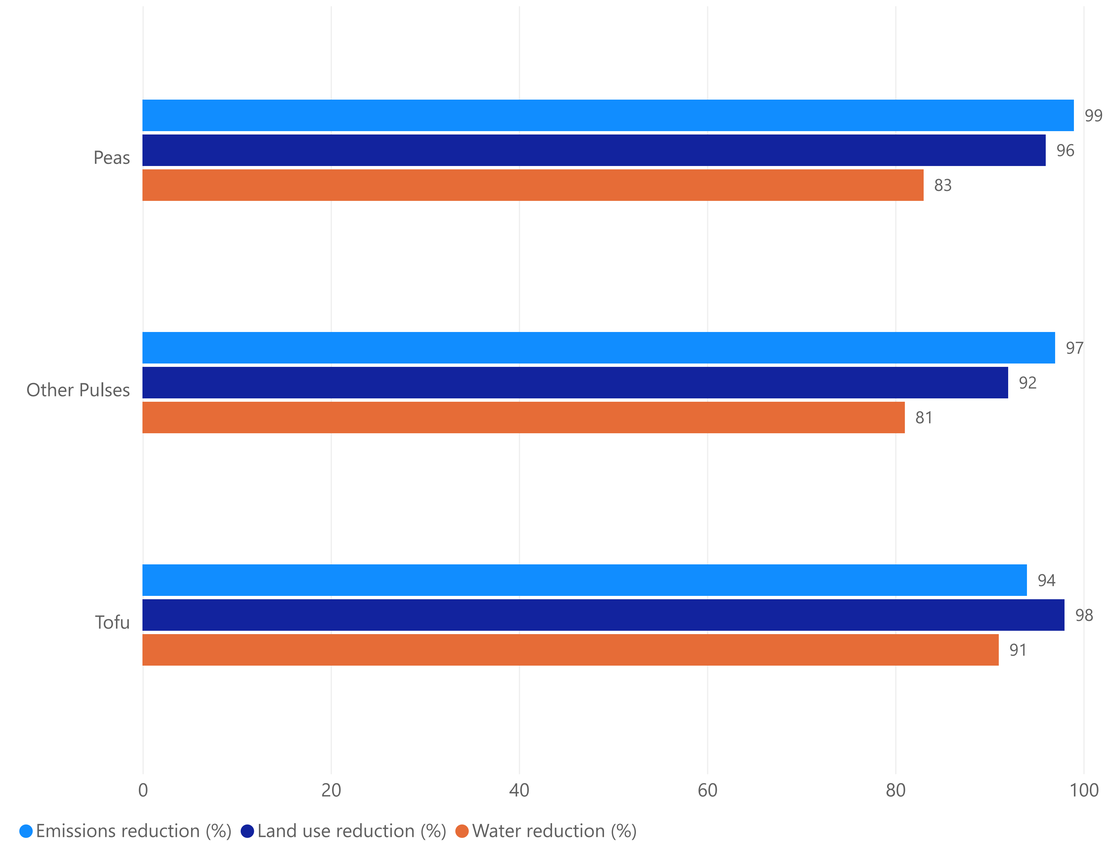

Nutrition tradeoffs of each swap

Savings are compared per 100g of protein where possible (milk to soy milk is per kg). For saturated fat and Nutri-Score points, a negative number means the plant option is better.

Plant food	Compared per	Protein (g per 100g)	Fiber (g per 100g)	Saturated fat (g per 100g)	Nutri-Score points	Products behind plant average
Other Pulses	per_100g_protein	-10.00	8.06	-3.63	-1.37	14159
Peas	per_100g_protein	-14.95	5.46	-3.70	-1.78	1837
Tofu	per_100g_protein	-7.69	1.66	-2.67	-1.45	1942

How much lower is the plant-based option?

Negative means the plant option is worse

Environmental cost vs. health, by food

Orange = animal-based, green = plant-based. Closer to the bottom left is better on both. Bubble size is the number of products. Beef is shown at the midpoint of its two production systems.
